

# Project info

## Project groups:

Between 1-4 people and you should name your project group. Default stack will be MERN (mongodb-express-react-node) stack. If your work uses other databases (SQL?) or different backends (JavaEE, Microsoft etc) use that. It will need to have a frontend, backend and a database. Some type of user and session management is also required. You need atleast one master user and others anonymous or you could do a real user management system. Data is transmitted between front- and backend using JSON with RESTful interfaces using all of the rules concerning REST APIs. There must also be documentation including software design document, small manual and a project synopsis.
